

Z373 Material Change

GUD Automotive has changed the Z373 Inline EFI fuel filter from an Alloy body to a Steel body.

The change in material will benefit the product fitment for the following reasons:

- Easier thread engagement. Fitment is easier due to a more solid feel associated with metal body
- Threaded steel fittings are less susceptible to thread damage from "cross threading"
- Increased ability of flared pipe fittings to consistently match mating surfaces for an effective leak free seal
- Reduces the possibility of filter damage due to over tightening of fittings.

Alloy Body

Steel Body

The Z373 in line EFI fuel filter is common to Ford Fairlane, Falcon and Fairmont models EA through to BF. New stock is available now.

For more on the new part introductions and application updates see Ryco's latest Distributor Notice available from www.rycofilters.com.au
